

## Appendix 8: 2016/7 CRM Electrophysiology/Ablation procedure volumes by operator

The table indicates the number of electrophysiology procedures associated with each operator. Simple ablations are defined as those that only target one or more of: the AV node, accessory pathways, slow AV nodal pathway (for AV nodal re-entry) and the cavotricuspid isthmus (typical atrial flutter). All other procedures are considered complex.

A procedure is assigned to each doctor entered as 1<sup>st</sup> or 2<sup>nd</sup> scrubbed operator, or as responsible consultant. Thus, each procedure can contribute to the totals for more than one doctor. Doctors have been identified solely using GMC No and names/registered specialties have been derived from the GMC List of Registered Medical Practitioners. The occasional appearance of unexpected specialties (such as psychiatry) is probably due to the entry of a valid but incorrect GMC No.

This is the first year that operator volumes are being reported, and figures may be underestimates, largely because of incomplete/incorrect entry of GMC No. For this reason, individual specialists are not explicitly measured against BHRS recommendations, but it is intended to do so in future reports.

Name	GMC No.	Primary Specialty	No ablation	Simple ablations	Complex ablations
